

HELPFUL TIPS FOR RECHARGING

A/C Recharging is fast & easy!

- Check for and repair leaks before recharging.
- Using a gauge ensures proper fill levels
- Do not overcharge or undercharge the A/C system; both conditions will produce poor cooling performance. Too much refrigerant will raise system pressures and may result in compressor or other component damage
- Check vent temperatures while charging. Cooler air should result as you're adding refrigerant.
- If you have added a can of refrigerant and are not getting cooler air - STOP! - see a professional! You may have leaks requiring repairs to the system.
